

Q. Ask the user to enter a temperature value in Celsius. Apply appropriate checks on the input and display error messages accordingly. If everything is fine then convert the temperature entered in Celsius into Fahrenheit. (hint: Celsius = (Fahrenheit – 32) * 5/9)

Algorithm:

1. Start
2. Define C, F as float
3. Input C
4. $F = ((9 * C) / 5) + 32$
5. Print F "is Fahrenheit"
6. Stop
